

CareerHub — Assignment 3.1

Rich UI & Form Patterns — toasts, a 3-step wizard, AlertDialog confirmations, skeletons & empty states

sonner

React Hook Form + Zod

Radix AlertDialog

nuqs

Next.js 15

All screenshots are real captures of the running app.

Contents

1. What I built
2. Files added & changed
3. Part 2 — Toasts
4. Part 3 — Application wizard
5. Part 4 — AlertDialog confirmations
6. Part 5 — Skeletons & empty states
7. Stretch goals

1. What I built

- **Toasts (sonner)** for mutations — closing a job and submitting the wizard fire toasts; field errors stay inline.
- **Three-step ApplicationWizard** on `/jobs/[id]` (alongside the existing apply panel): Details → Application → Review, one Zod schema, per-step `trigger()`, localStorage draft auto-save + restore, role gating.

- **AlertDialog confirmations** for the two destructive actions: closing a listing and discarding a draft.
- **Skeletons & two distinct empty states** on `/jobs`.
- **Stretch A/B/C**: cross-tab draft sync, animated step transitions, LinkedIn live preview.

2. Files added & changed

File		Purpose
src/components/ApplicationWizard.tsx	NEW	The 3-step wizard + draft autosave + discard dialog + stretch A/B/C.
src/components/ui/alert-dialog.tsx	NEW	shadcn/Radix AlertDialog primitive.
src/components/ClearFiltersButton.tsx	NEW	Resets every nuqs filter param (filtered empty state).
src/components/CloseJobButton.tsx	CHANGED	AlertDialog + useTransition Server Action + sonner toast (no inline banner).
src/app/layout.tsx	CHANGED	Added the sonner <code><Toaster/></code> .
src/app/jobs/[id]/page.tsx	CHANGED	Renders the wizard alongside the apply panel; passes <code>isCandidate</code> .
src/app/jobs/(board)/page.tsx	CHANGED	Two distinct empty states from unfiltered vs filtered counts.
src/app/jobs/(board)/loading.tsx	CHANGED	Uses the paired JobCardSkeleton (6 cards).

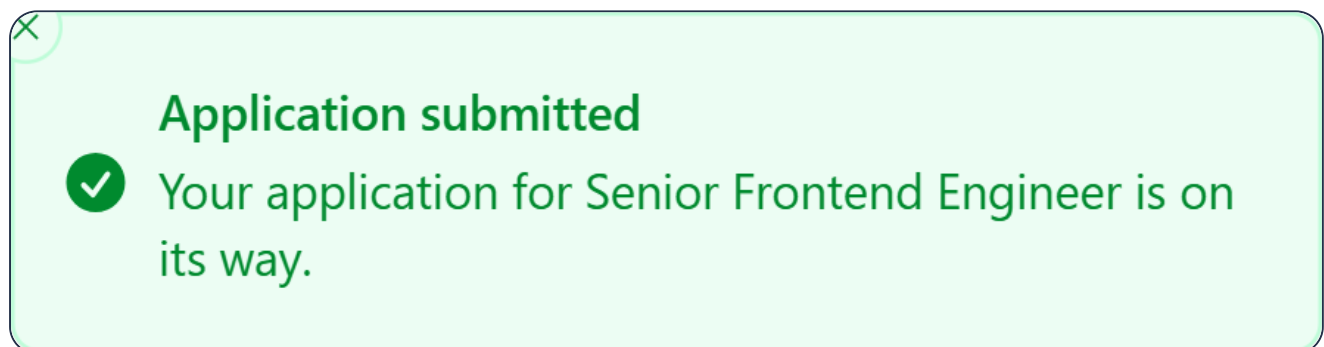

3. Part 2 — Toasts

The `<Toaster/>` sits in the root layout, bottom-right so it never overlaps the sticky top nav:

```
<Toaster position="bottom-right" richColors closeButton />
```

Mutations fire toasts; validation stays inline. The wizard's submit:

```
toast.success("Application submitted", {  
  description: `Your application for ${jobTitle} is on its way.`,  
});
```

Submitting the wizard fires a success toast, then resets to step 1.

4. Part 3 — The application wizard

One Zod schema covers all three steps, with a cross-step refine on the LinkedIn URL. Navigation validates only the current step via `trigger()` with an explicit field list:

```
const STEP_FIELDS = [
  ["fullName", "email", "phone"], // step 1
  ["coverLetter", "linkedinUrl", "source"], // step 2
  [], // step 3 (review only)
];
const valid = await trigger(STEP_FIELDS[step], { shouldFocus: true });
if (!valid) return; // Next does not advance on invalid current step
```

Draft auto-save uses a `form.watch()` subscription (with cleanup), keyed to the job:

```
const sub = watch((values) => {
  localStorage.setItem(`careerhub-application-${jobId}`, JSON.stringify(values));
  setHasDraft(true);
});
return () => sub.unsubscribe(); // unsubscribe so it can't fire after unmount
```

Next

On reload a saved draft is restored with a dismissible banner + a Discard option.

5. Part 4 — AlertDialog confirmations

Closing a job is a Server Action. `AlertDialogAction` renders in a portal outside any form, so `type="submit"` there does nothing. The fix: control the dialog with state and call the action programmatically in a transition:

```
function handleConfirm() {
  const fd = new FormData();
  fd.set("jobId", jobId);
  startTransition(async () => {
    const result = await closeJobListing(null, fd); // called, not submitted
    result?.status === "success"
      ? toast.success(`Closed "${result.jobTitle}"`)
      : toast.error(result?.message ?? "Couldn't close the listing.");
    setOpen(false);
  });
}
```

Discard your draft?

Your saved application progress will be permanently deleted. This cannot be undone.

Keep draft

Discard draft

The shared AlertDialog component — here guarding 'Discard draft' (Part 4b). Closing a listing (Part 4a) uses the same modal with the 'Close this listing?' copy; it can't be dismissed by an outside click.

6. Part 5 — Skeletons & empty states

The two empty states are decided server-side from the unfiltered vs filtered counts:

```
const databaseEmpty = totalUnfiltered === 0; // → no action
// else if filtered length 0 → "No jobs match your search" + <ClearFiltersButton/>
```

The loading skeleton uses the paired `JobCardSkeleton` (6 cards) so dimensions match the real `JobCard` and nothing shifts on swap-in.

No jobs match your search

None of the 7 live listings match "zzzzzzzz". Try a different search, or clear your filters to see everything.

× Clear all filters

Filtered-out empty state with a 'Clear all filters' button that resets every nuqs param.

7. Stretch goals

- **A — Cross-tab sync:** a `window 'storage'` listener updates the draft/banner when another tab edits the same key. The event fires only in *other* tabs of the origin, never the one that wrote the change.
- **B — Animated transitions:** library-free CSS keyframes; a direction state picks slide-from-right (Next) vs slide-from-left (Back) on an overflow-hidden container.
- **C — LinkedIn preview:** best-effort preview from the URL slug with an `<img onError>` fallback to initials (LinkedIn has no public image API).
