

CareerHub — Assignment 3.2

Applicant Profile · Document uploads · Auto-fill on apply · Resume where you stopped

Next.js 15 App Router

React 19

TypeScript strict

Tailwind v4

localStorage data layer

All screenshots below are real captures of the running app.

What's in here

1. What I built (summary)
2. How the pieces fit together
3. Files I added & changed
4. The data layer — profile & drafts
5. The profile wizard (the UI)
6. Photo & PDF uploads
7. Auto-fill when applying
8. Resume where you stopped
9. How to use it

1. What I built

A signed-in job-seeker now has a **profile** they fill in **once**, through a guided multi-step form:

- **Personal details** — name, email, phone, ID number, date of birth, nationality, gender, and a **profile photo**.
- **Address** — street, city, province (South African list), postal code, country.
- **Qualifications** — four document slots uploaded as **PDF**: *Matric certificate, ID copy, Driver's licence, Tertiary qualification*.
- **Review** — a read-back of everything with quick "Edit" jumps.

Everything is saved as the user goes, so the three headline requirements are met:

- **Stored on the profile** — all the information lives in one profile record (per account).
- **Auto-fill on apply** — the application form is pre-filled from the profile, and saved documents attach in one click, so you never start from the beginning.
- **Resume where you stopped** — if you start an application (or the profile) and leave without finishing, your answers are saved and you're shown exactly where you stopped when you come back.

2. How the pieces fit together

One client-side data layer (`src/lib/profile-store.ts` , backed by `localStorage` — the same approach as the existing app) is the single source of truth. The profile wizard writes to it; the apply form reads from it for auto-fill and writes a *draft* back to it on every change.

```

Profile wizard —writes→  profile-store (localStorage)
                        |
                        | profiles[email]
                        | drafts[email::jobId]
                        |
                        ▼
Apply form  ←--auto-fill-- reads profile
Apply form  —autosave→  writes draft  → Resume banner reads latest dr

```

3. Files I added & changed

File		Purpose
src/lib/profile-store.ts	NEW	Profile + draft data layer (localStorage): types, get/save, completion %, file→data-URL, draft get/save/clear.
src/app/profile/page.tsx	NEW	The 4-step profile wizard with stepper, per-step save and resume-to-last-step.
src/components/profile/DocUpload.tsx	NEW	Reusable PDF upload slot (validate, preview, view/replace/remove).
src/components/profile/ResumeBanner.tsx	NEW	"Unfinished application" banner driven by the latest saved draft.
src/app/apply/[jobId]/page.tsx	CHANGED	Auto-fill from profile, attach saved documents, autosave + restore a draft, clear on submit.
src/components/Navbar.tsx	CHANGED	Added a "My profile" link for candidates (desktop + mobile menu).

4. The data layer — profile & drafts

The profile is one record per user, keyed by email. Files (photo + PDFs) are stored inline as base64 data URLs so they survive a reload with no backend. The shape:

```
export interface ApplicantProfile {
  email: string; // owner key (lower-cased)
  photoDataUrl: string; // profile picture (base64, "" when none)
  personal: PersonalDetails;
  address: Address;
  qualifications: Qualifications; // matric / idCopy / license / tertiary
  completedSteps: number[]; // which wizard steps are done
  lastStep: number; // where the user was last – used to resume
  createdAt: string; updatedAt: string;
}
```

Completion is derived (not stored), driving the progress bar and the "complete" gate:

```
export function profileCompletion(profile) {
  const personalDone = !!((p.fullName && p.email && p.phone && p.idNumber));
  const addressDone = !!((a.line1 && a.city && a.province && a.postalCode));
  const qualificationsDone = REQUIRED_QUALIFICATIONS.every(k => quals[k] !== null);
  const percent = Math.round((done3 / 3) * 100);
  return { percent, personalDone, addressDone, qualificationsDone, complete }
}
```

Uploads go through one helper that enforces type + size and returns a stored doc:

```
export function fileToDataURL(file, { accept, maxBytes }) {
  // reject if wrong type ("pdf" | "image") or over maxBytes,
  // else FileReader.readAsDataURL → { fileName, dataUrl, size, uploadedAt }
}
```

5. The profile wizard (the UI)

A four-step stepper. Each "Save & continue" persists the step and remembers it as `lastStep` so a returning user lands back on the right step automatically.

Step 4 — Review everything, with quick Edit jumps back to any step.

The step is saved like this — the current step is marked complete and the next becomes `lastStep` :

```
function persist(current, nextStep) {
  setProfile((p) => {
    const completedSteps = [... new Set([... p.completedSteps, current])].sort()
    return saveProfile({ ... p, completedSteps, lastStep: nextStep });
  });
}
// On load we resume to where they stopped:
setStep(Math.min(savedProfile.lastStep, STEPS.length - 1));
```

6. Photo & PDF uploads

The four qualification slots reuse one controlled `DocUpload` component. It validates (PDF, ≤ 4 MB), shows the uploaded state, and offers View / Replace / Remove. The profile photo uses the same `fileToDataUrl` helper with `accept: "image"`.

```
<DocUpload
  label={QUALIFICATION_LABELS[key]} // e.g. "Matric certificate"
  hint={REQUIRED_QUALIFICATIONS.includes(key) ? "(required)" : "(optional)"}
  value={qualifications[key]}
  onChange={(doc) => setQualification(key, doc)} // null clears it
/>
```

7. Auto-fill when applying

When a job-seeker with a profile opens an application, the form is pre-filled from their profile and their saved documents can be attached with a single checkbox — so they never re-type anything.

No

☐ Attach my saved documents from my profile

Matric certificate, ID copy, Driver's licence, Tertiary qualification

Upload your CV (PDF)

Choose File

No file chosen

☐ I accept the terms and conditions and consent to my information being shared with Yoco.

Submit application

© 2026 CareerHub. A learning project.

Built with Next.js 15 · React 19 · TypeScript · Tailwind CSS v4

Applying — name, email, phone, ID and nationality pre-filled; saved documents attachable in one click.

```
// One-time load on the apply page:
const prof = getProfile(user.email);
if (prof) {
  setFullName(prof.personal.fullName || user.name);
  setEmail(prof.personal.email || user.email);
  setPhone(prof.personal.phone);
  setNationality(prof.personal.nationality);
  setIdNumber(prof.personal.idNumber);
  setPrefilled(true); // shows the "pre-filled from your profile" banner
}
```

8. Resume where you stopped

Every change on the apply form is written to a per-job **draft**. If the user leaves without submitting, the next time they sign in the profile page greets them with an "unfinished application" banner, and reopening the form restores their answers. The draft is cleared on a successful submit.

Built with Next.js 15 · React 19 · TypeScript · Tailwind CSS v4

Reopening the application restores every answer you'd entered.

The autosave only writes once something actually changes (a fresh, untouched pre-fill never creates a draft):

```
useEffect(() => {
  if (!user || !job || submitted || alreadyApplied) return;
  const snapshot = JSON.stringify({ fullName, email, phone, ... });
  if (snapshot === baselineRef.current) return; // nothing changed yet
  saveDraft({ jobId: job.id, jobTitle: job.title, company: job.company,
    email: user.email, values: { ...currentFields } });
}, [user, job, submitted, alreadyApplied, fullName, email, ...]);

// On submit:
saveApplication(application);
clearDraft(user.email, job.id); // draft gone → banner clears
```

9. How to use it

- 1 Sign in as a candidate, then open **My profile** from the top bar.
- 2 Work through Personal → Address → Qualifications, uploading your photo and the four PDFs. Each step saves as you go.
- 3 Open any job and click **Apply** — the form is already filled from your profile; tick "Attach my saved documents".
- 4 If you close the tab mid-application, just sign back in: the profile page shows your unfinished application and reopening it restores everything.
